At time of the Action: Claims 1-2 and 5-10.

• After this Response: Claims 1-2 and 5-10.

Canceled or Withdrawn Claims: None.

Amended Claims: None.

New Claims: None.

(Previously Presented) Apparatus for displaying information from a
portable communications device, having a data output port and a scrollable
display, on a remote projection display device having a data input port, the
apparatus comprising:

a first data port associated with a cradle for receiving the portable communications device, the first data port adapted to be coupled to the data output port of the portable communications device, the first data port for receiving remote data from the portable communications device, the remote data including remote audio data and remote visual data; and

a second data port that is adapted to be coupled to the data input port of the remote projection display device, the second data port for automatically, upon placement of the portable communications device into the cradle, providing to the remote projection display device a representation of the remote visual data received from the portable communications device;

wherein the apparatus is configured to receive scrolling commands from a scroll controller, the scroll controller being adapted to cause the remote projection display device to provide a scrolling display of information that corresponds to the scrollable display of the portable communications device;

wherein the scroll controller comprises a control device that is integrated into an automobile steering wheel and is adapted to be electrically coupled to the remote projection display device;

wherein the apparatus is also configured to receive commands from a display controller, the display controller being adapted to cause the remote projection display device to turn on and off the displayed information;

wherein the display controller also comprises a control device that is integrated into the automobile steering wheel and is adapted to be electrically connected to the remote projection display device;

wherein the cradle includes an audio serial port for receiving the remote audio data, a speaker for outputting the remote audio data, and a microphone for receiving audio data that is to be sent back through the portable communications device; and

wherein the cradle is also adapted to couple to a hands-free kit, such that when the cradle couples to the hands-free kit the hands-free kit outputs the remote audio data and receives the audio data that is to be sent back through the portable communications device.

2. (Previously Presented) Apparatus according to claim 1, further
comprising:
a data translator, coupled between the first data port and the second
data port, that formats the remote visual data received from the portable
communications device into a format from which the remote projection display
device can provide a projected display.
3. (Cancelled).
4. (Cancelled).
5. (Original) Apparatus according to claim 1, wherein the portable
communications device is an Internet appliance.

- (Original) Apparatus according to claim 1, wherein the portable 6. communications device is a cellular telephone.
- 7. (Original) Apparatus according to claim 1, wherein the portable communications device is a personal digital assistant.
- (Original) Apparatus according to claim 1, wherein the remote projection display device provides the projected display on an automobile windshield.

 10. (Previously Presented) Apparatus for hands-free communication using a portable communications device, the apparatus adapted to receive remote data from the portable communications device via a wireless telecommunications link, the portable communications device having an externally accessible data output port and the remote data including remote audio data and remote visual data, the apparatus comprising:

a housing that is adapted to receive the portable communications device:

a sensor for detecting placement of the portable communications device into the housing;

a first interface for coupling the data output port of the portable communications device to the housing;

a second interface for coupling the housing to a data input port of a remote projection display device;

a processor for receiving the remote data from the portable communications device, converting the received remote visual data to a format displayable by a remote projection display device, and forwarding the converted remote visual data to the remote projection display device via the second interface for automatic display upon detection of placement of the portable communications device into the housing;

a serial port for receiving the remote audio data;

wherein the apparatus is adapted to couple to a hands-free kit, such that when the apparatus couples to the hands-free kit the hands-free kit outputs the remote audio data and receives the audio data that is to be sent back through the portable communications device;

wherein the portable communications device includes a scrolling capability, and the processor includes a scroll controller that receives scrolling commands from a remote scroll control device that is adapted to be integrated into an automobile steering wheel and adapted to cause the remote projection display device to provide a scrolling display of the converted remote visual data based on the scrolling commands;

wherein the processor is configured to receive commands from a remote toggle controller, the remote toggle controller being adapted to cause the remote projection display device to toggle the display of the remote visual data between on and off states in response to actuation of the remote toggle controller;

wherein the second interface is a wireless interface that is adapted to couple the housing to a corresponding wireless interface of the remote projection display;

wherein the processor includes a data translator for the converting of the received remote visual data;

wherein the first interface is a serial port connector and the second interface is a serial port connector; and

LEE & HAYES, PLLC

ATTORNEY DOCKET NO BEI-0076US

wherein a connection between the first interface and the data output port of the portable communications device is achieved upon receipt of the portable communications device.

11.-16. (Cancelled)
